

Package ‘sigr’

August 20, 2023

Type Package

Title Succinct and Correct Statistical Summaries for Reports

Version 1.1.5

Date 2023-08-19

URL <https://github.com/WinVector/sigr/>,

<https://winvector.github.io/sigr/>

Maintainer John Mount <jmount@win-vector.com>

BugReports <https://github.com/WinVector/sigr/issues>

Description Succinctly and correctly format statistical summaries of various models and tests (F-test, Chi-Sq-test, Fisher-test, T-test, and rank-significance). This package also includes empirical tests, such as Monte Carlo and bootstrap distribution estimates.

License GPL-2 | GPL-3

RoxygenNote 7.2.3

Depends R (>= 3.2.1)

Imports wraph (>= 2.0.9), stats

Suggests pwr, parallel, knitr, rmarkdown, tinytest

VignetteBuilder knitr

ByteCompile true

NeedsCompilation no

sigr-package

*sigr: Format Significance Summaries for Reports***Description**

Succinctly format significance summaries of various models and tests (F-test, Chi-Sq-test, Fisher-test, T-test, and rank-significance). The main purpose is unified reporting and planning of experimental results, working around issue such as the difficulty of extracting model summary facts (such as with 'lm'/'glm'). This package also includes empirical tests, such as bootstrap estimates.

Details

add_ROC_derived_columns

*Add ROC derived columns.***Description**

Add ROC columns derived from sensitivity and specificity.

Usage

```
add_ROC_derived_columns(d, positive_prevalence)
```

Arguments

- d input data frame, must at least of columns Sensitivity and Specificity
- positive_prevalence scalar, the prevalence of the positive class or prior odds

Value

extended data frame with more columns

Examples

```
d <- data.frame(pred = 1:4, truth = c(TRUE, FALSE, TRUE, TRUE))
roc <- build_ROC_curve(d$pred, d$truth)
add_ROC_derived_columns(roc, mean(d$truth))
```

```
as.character.sig_r_statistic
as.character
```

Description

as.character

Usage

```
## S3 method for class 'sig_r_statistic'
as.character(x, ...)
```

Arguments

- x sigr wrapper to print
- ... extra arguments for *sigr::render*

Value

formatted string

Examples

```
as.character(wrapSignificance(1/300))
```

Bernoulli_diff_stat *Compute the distribution of differences of replacement samples of two Binomial or Bernoulli experiments.*

Description

Assuming $\max(nA, nB) \% \min(nA, nB) == 0$: compute the distribution of differences of weighted sums between $\max(1, nB/nA)*\text{sum}(a)$ and $\max(1, nA/nB)*\text{sum}(b)$ where a is a 0/1 vector of length nA with each item 1 with independent probability $(kA+kB)/(nA+nB)$, and b is a 0/1 vector of length nB with each item 1 with independent probability $(kA+kB)/(nA+nB)$. Then return the significance of a direct two-sided test that the absolute value of this difference is at least as large as the `test_rate_difference` (if supplied) or the empirically observed rate difference $\text{abs}(nB*kA - nA*kB)/(nA*nB)$. The idea is: under this scaling differences in success rates between the two processes are easily observed as differences in counts returned by the scaled processes. The method can be used to get the exact probability of a given difference under the null hypothesis that both the A and B processes have the same success rate $(kA+kB)/(nA+nB)$. When nA and nB don't divide evenly into each other two calculations are run with the larger process is alternately padded and truncated to look like a larger or smaller experiment that meets the above conditions. This gives us a good range of significances.

Usage

```
Bernoulli_diff_stat(kA, nA, kB, nB, test_rate_difference, common_rate)
```

Arguments

<code>kA</code>	number of A successes observed.
<code>nA</code>	number of A experiments.
<code>kB</code>	number of B successes observed.
<code>nB</code>	number of B experiments.
<code>test_rate_difference</code>	numeric, difference in rate of A-B to test. Note: it is best to specify this prior to looking at the data.
<code>common_rate</code>	rate numeric, assumed null-rate.

Details

Note the intent is that we are measuring the results of an A/B test with $\max(nA, nB) \% \min(nA, nB) == 0$ (no padding needed), or $\max(nA, nB) \gg \min(nA, nB)$ (padding is small effect).

The idea of converting a rate problem into a counting problem follows from reading Wald's *Sequential Analysis*.

For very small p-values the calculation is sensitive to rounding in the observed ratio-difference, as an arbitrarily small change in test-rate can move an entire set of observed differences in or out of the significance calculation.

Value

Bernoulli difference test statistic.

Examples

```
Bernoulli_diff_stat(2000, 5000, 100, 200)
Bernoulli_diff_stat(2000, 5000, 100, 200, 0.1)
Bernoulli_diff_stat(2000, 5000, 100, 199)
Bernoulli_diff_stat(2000, 5000, 100, 199, 0.1)
Bernoulli_diff_stat(100, 200, 2000, 5000)

# sigr adjusts experiment sizes when lengths
# don't divide into each other.
Bernoulli_diff_stat(100, 199, 2000, 5000)
Bernoulli_diff_stat(100, 199, 2000, 5000)$pValue
```

`build_ROC_curve` calculate ROC curve.

Description

Based on: <https://blog.revolutionanalytics.com/2016/08/roc-curves-in-two-lines-of-code.html>

Usage

```
build_ROC_curve(modelPredictions, yValues, ..., na.rm = FALSE, yTarget = TRUE)
```

Arguments

modelPredictions	numeric predictions (not empty)
yValues	truth values (not empty, same length as model predictions)
...	force later arguments to bind by name.
na.rm	logical, if TRUE remove NA values.
yTarget	value considered to be positive.

Value

the ROC graph of Score (model score), Sensitivity, and Specificity. Guaranteed to have the (0, 0) and (1, 1) (1-Specificity,Sensitivity) endpoints.

Examples

```
sigr::build_ROC_curve(1:4, c(TRUE, FALSE, TRUE, TRUE))
```

calcAUC*calculate AUC.***Description**

Based on: <https://blog.revolutionanalytics.com/2016/08/roc-curves-in-two-lines-of-code.html>

Usage

```
calcAUC(modelPredictions, yValues, ..., na.rm = FALSE, yTarget = TRUE)
```

Arguments

<code>modelPredictions</code>	numeric predictions (not empty), ordered (either increasing or decreasing)
<code>yValues</code>	truth values (not empty, same length as model predictions)
<code>...</code>	force later arguments to bind by name.
<code>na.rm</code>	logical, if TRUE remove NA values.
<code>yTarget</code>	value considered to be positive.

Value

area under curve

Examples

```
sigr:::calcAUC(1:4, c(TRUE,FALSE,TRUE,TRUE)) # should be 2/3
```

calcDeviance*Calculate deviance.***Description**

Calculate deviance.

Usage

```
calcDeviance(pred, y, na.rm = FALSE, eps = 1e-06)
```

Arguments

pred	numeric predictions
y	logical truth
na.rm	logical, if TRUE remove NA values
eps	numeric, smoothing term

Value

deviance

Examples

```
sigr::calcDeviance(1:4,c(TRUE,FALSE,TRUE,TRUE))
```

calcSSE*Calculate sum of squared error.*

Description

Calculate sum of squared error.

Usage

```
calcSSE(pred, y, na.rm = FALSE)
```

Arguments

pred	numeric predictions
y	numeric truth
na.rm	logical, if TRUE remove NA values

Value

sum of squared error

Examples

```
sigr::calcSSE(1:4,c(1,0,1,1))
```

`estimateDifferenceZeroCrossing`

Studentized estimate of how often a difference is below zero.

Description

Studentized estimate of how often a difference is below zero.

Usage

```
estimateDifferenceZeroCrossing(resampledDiffs, na.rm = FALSE)
```

Arguments

<code>resampledDiffs</code>	numeric vector resampled observations
<code>na.rm</code>	logical, if TRUE remove NA values

Value

estimated probability of seeing a re-sampled difference below zero.

Examples

```
set.seed(2352)
resampledDiffs <- rnorm(10)+1
estimateDifferenceZeroCrossing(resampledDiffs)
```

`find_area_q`

Find area matching polynomial curve.

Description

Based on <https://win-vector.com/2020/09/13/why-working-with-auc-is-more-powerful-than-one-might-think/>

Usage

```
find_area_q(area, ..., n_points = 101)
```

Arguments

<code>area</code>	area to match
<code>...</code>	not used, force later arguments to bind by name
<code>n_points</code>	how many points to use to estimate area.

Value

q that such that curve $1 - (1 - (1-\text{Specificity})^q)^{(1/q)}$ matches area

Examples

```
find_area_q(0.75)
```

find_AUC_q

Find area matching polynomial curve.

Description

Based on <https://win-vector.com/2020/09/13/why-working-with-auc-is-more-powerful-than-one-might-think/>

Usage

```
find_AUC_q(
  modelPredictions,
  yValues,
  ...,
  na.rm = FALSE,
  yTarget = TRUE,
  n_points = 101
)
```

Arguments

modelPredictions	numeric predictions (not empty), ordered (either increasing or decreasing)
yValues	truth values (not empty, same length as model predictions)
...	force later arguments to bind by name.
na.rm	logical, if TRUE remove NA values.
yTarget	value considered to be positive.
n_points	number of points to use in estimates.

Value

q that such that curve $1 - (1 - (1-\text{ideal_roc\$Specificity})^q)^{(1/q)}$ matches area

Examples

```
d <- data.frame(pred = 1:4, truth = c(TRUE,FALSE,TRUE,TRUE))
q <- find_AUC_q(d$pred, d$truth)
roc <- build_ROC_curve(d$pred, d$truth)
ideal_roc <- data.frame(Specificity = seq(0, 1, length.out = 101))
ideal_roc$Sensitivity <- sensitivity_from_specificity_q(ideal_roc$Specificity, q)
# library(ggplot2)
# ggplot(mapping = aes(x = 1 - Specificity, y = Sensitivity)) +
#   geom_line(data = roc, color = "DarkBlue") +
#   geom_line(data = ideal_roc, color = "Orange") +
#   theme(aspect.ratio=1) +
#   ggtitle("example actual and ideal curve")
```

find_matching_a1_1b *Find beta-1 shape parameters matching the conditional distributions.*

Description

Based on [doi:10.1177/0272989X15582210](https://doi.org/10.1177/0272989X15582210). Fits a Beta(a, 1) distribution on positive examples and an Beta(1, b) distribution on negative examples.

Usage

```
find_matching_a1_1b(
  modelPredictions,
  yValues,
  ...,
  yTarget = TRUE,
  step_size = 0.001
)

find_ROC_matching_ab1(
  modelPredictions,
  yValues,
  ...,
  yTarget = TRUE,
  step_size = 0.001
)
```

Arguments

modelPredictions	numeric predictions (not empty), ordered (either increasing or decreasing)
yValues	truth values (not empty, same length as model predictions)
...	force later arguments to bind by name.

yTarget value considered to be positive.
 step_size size of steps in curve drawing

Value

beta curve shape parameters

Examples

```
d <- rbind(
  data.frame(x = rbeta(1000, shape1 = 6, shape2 = 4), y = TRUE),
  data.frame(x = rbeta(1000, shape1 = 2, shape2 = 5), y = FALSE)
)
find_ROC_matching_ab1(modelPredictions = d$x, yValues = d$y)
# should be near
# shape1_pos shape2_pos shape1_neg shape2_neg      a          b
# 3.985017   1.000000   1.000000   1.746613   3.985017   1.746613
#
# # How to land what you want as variables
# unpack[a, b] <-
#   find_matching_a1_1b(modelPredictions = d$x, yValues = d$y)
```

find_matching_conditional_betas

Find beta shape parameters matching the conditional distributions.

Description

Based on <https://win-vector.com/2020/09/13/why-working-with-auc-is-more-powerful-than-one-might-think/>
 Used to find one beta distribution on positive examples, and another on negative examples.

Usage

```
find_matching_conditional_betas(modelPredictions, yValues, ..., yTarget = TRUE)

find_ROC_matching_ab(modelPredictions, yValues, ..., yTarget = TRUE)
```

Arguments

modelPredictions numeric predictions (not empty), ordered (either increasing or decreasing)
 yValues truth values (not empty, same length as model predictions)
 ... force later arguments to bind by name.
 yTarget value considered to be positive.

Value

beta curve shape parameters

Examples

```
d <- rbind(
  data.frame(x = rbeta(1000, shape1 = 6, shape2 = 4), y = TRUE),
  data.frame(x = rbeta(1000, shape1 = 2, shape2 = 3), y = FALSE)
)
find_matching_conditional_betas(modelPredictions = d$x, yValues = d$y)
# should be near
# shape1_pos shape2_pos shape1_neg shape2_neg
# 6           4           2           3
#
# # How to land all as variables
# unpack[shape1_pos, shape2_pos, shape1_neg, shape2_neg] <-
#   find_ROC_matching_ab(modelPredictions = d$x, yValues = d$y)
```

fit_beta_shapes *Fit beta parameters from data.*

Description

Fit shape1, shape2 using the method of moments.

Usage

```
fit_beta_shapes(x)
```

Arguments

x	numeric predictions
---	---------------------

Value

beta shape1, shape2 parameters in a named list

Examples

```
x <- rbeta(1000, shape1 = 3, shape2 = 5.5)
fit_beta_shapes(x) # should often be near [3, 5.5]
```

```
format.sigr_statistic Format
```

Description

Format

Usage

```
## S3 method for class 'sigr_statistic'  
format(x, ...)
```

Arguments

x	sig _r wrapper to print
...	extra arguments for sigr::render

Value

formatted string

Examples

```
format(wrapSignificance(1/300))
```

```
getRenderingFormat     Detect rendering format (using knitr).
```

Description

Detect rendering format (using knitr).

Usage

```
getRenderingFormat()
```

Value

rendering format

Examples

```
getRenderingFormat()
```

<code>model_utility</code>	<i>Estimate model utility</i>
----------------------------	-------------------------------

Description

Compute the utility of a model score on a classification data set. For each threshold of interest we compute the utility of the classification rule of taking all items with model score greater than or equal to the threshold. The user specifies the outcome (a binary classification target), a model score (numeric), and the utility values (positive, negative, or zero) of each case: true positives, false positives, true negatives, and false negatives. What is returned is a table of model thresholds and the total value of using this model score plus the given threshold as a classification rule. NA is used to mark a threshold where no rows are selected.

Usage

```
model_utility(
  d,
  model_name,
  outcome_name,
  ...,
  outcome_target = TRUE,
  true_positive_value_column_name = "true_positive_value",
  false_positive_value_column_name = "false_positive_value",
  true_negative_value_column_name = "true_negative_value",
  false_negative_value_column_name = "false_negative_value"
)
```

Arguments

<code>d</code>	A data.frame containing all data and outcome values.
<code>model_name</code>	Name of the column containing model predictions.
<code>outcome_name</code>	Name of the column containing the truth values.
<code>...</code>	Not used, forces later argument to be specified by name.
<code>outcome_target</code>	truth value considered to be TRUE.
<code>true_positive_value_column_name</code>	column name of per-row values of true positive cases. Only used on positive instances.
<code>false_positive_value_column_name</code>	column name of per-row values of false positive cases. Only used on negative instances.
<code>true_negative_value_column_name</code>	column name of per-row values of true negative cases. Only used on negative instances.
<code>false_negative_value_column_name</code>	column name of per-row values of false negative cases. Only used on positive instances.

Details

A worked example can be found here: <https://github.com/WinVector/sigr/blob/main/extras/UtilityExample.md>.

Value

data.frame of all threshold values.

Examples

```
d <- data.frame(
  predicted_probability = c(0, 0.5, 0.5, 0.5),
  made_purchase = c(FALSE, TRUE, FALSE, FALSE),
  false_positive_value = -5,      # acting on any predicted positive costs $5
  true_positive_value = 95,       # revenue on a true positive is $100 minus action cost
  true_negative_value = 0.001,    # true negatives have no value in our application
                                # but just give ourselves a small reward for being right
  false_negative_value = -0.01   # adding a small notional tax for false negatives,
                                # don't want our competitor getting these accounts.
)

values <- model_utility(d, 'predicted_probability', 'made_purchase')
best_strategy <- values[values$total_value >= max(values$total_value), ][1, ]
t(best_strategy)

# a bigger example

d <- data.frame(
  predicted_probability = stats::runif(100),
  made_purchase = sample(c(FALSE, TRUE), replace = TRUE, size = 100),
  false_positive_value = -5,      # acting on any predicted positive costs $5
  true_positive_value = 95,       # revenue on a true positive is $100 minus action cost
  true_negative_value = 0.001,    # true negatives have no value in our application
                                # but just give ourselves a small reward for being right
  false_negative_value = -0.01   # adding a small notional tax for false negatives,
                                # don't want our competitor getting these accounts.
)

values <- model_utility(d, 'predicted_probability', 'made_purchase')

# plot the estimated total utility as a function of threshold
plot(values$threshold, values$total_value)

best_strategy <- values[values$total_value >= max(values$total_value), ][1, ]
t(best_strategy)

# without utilities example
```

```
d <- data.frame(
  predicted_probability = c(0, 0.5, 0.5, 0.5),
  made_purchase = c(FALSE, TRUE, FALSE, FALSE))
model_utility(d, 'predicted_probability', 'made_purchase')
```

permTestAUC*Perform AUC permutation test.***Description**

Estimate significance of AUC by permutation test.

Usage

```
permTestAUC(
  d,
  modelName,
  yName,
  yTarget = TRUE,
  ...,
  na.rm = FALSE,
  returnScores = FALSE,
  nrep = 100,
  parallelCluster = NULL
)
```

Arguments

<code>d</code>	data.frame
<code>modelName</code>	character model column name
<code>yName</code>	character outcome column name
<code>yTarget</code>	target to match to <code>y</code>
<code>...</code>	extra arguments (not used)
<code>na.rm</code>	logical, if TRUE remove NA values
<code>returnScores</code>	logical if TRUE return detailed permutedScores
<code>nrep</code>	number of permutation repetitions to estimate p values.
<code>parallelCluster</code>	(optional) a cluster object created by package parallel or package snow

Value

AUC statistic

Examples

```
set.seed(25325)
d <- data.frame(x1=c(1,2,3,4,5,6,7,7),
                 y=c(FALSE,TRUE,FALSE,FALSE,
                      TRUE,TRUE,FALSE,TRUE))
permTestAUC(d, 'x1', 'y', TRUE)
```

`permutationScoreModel` *Empirical permutation test of significance of scoreFn(modelValues,yValues) >= scoreFn(modelValues,perm(yValues)).*

Description

Treat permutation re-samples as similar to bootstrap replications.

Usage

```
permutationScoreModel(
  modelValues,
  yValues,
  scoreFn,
  ...,
  na.rm = FALSE,
  returnScores = FALSE,
  nRep = 100,
  parallelCluster = NULL
)
```

Arguments

<code>modelValues</code>	numeric array of predictions.
<code>yValues</code>	numeric/logical array of outcomes, dependent, or truth values
<code>scoreFn</code>	function with signature <code>scoreFn(modelValues,yValues)</code> returning scalar numeric score.
<code>...</code>	not used, forces later arguments to be bound by name
<code>na.rm</code>	logical, if TRUE remove NA values
<code>returnScores</code>	logical if TRUE return detailed permutedScores
<code>nRep</code>	integer number of repetitions to perform
<code>parallelCluster</code>	optional snow-style parallel cluster.

Value

summaries

Examples

```
set.seed(25325)
y <- 1:5
m <- c(1,1,2,2,2)
cor.test(m,y,alternative='greater')
f <- function(modelValues,yValues) cor(modelValues,yValues)
permutationScoreModel(m,y,f)
```

`print.sigr_statistic` *Print*

Description

Print

Usage

```
## S3 method for class 'sigr_statistic'
print(x, ...)
```

Arguments

<code>x</code>	sigr wrapper to print
...	extra arguments for sigr::render and print

Value

formatted string

Examples

```
print(wrapSignificance(1/300))
```

render	<i>Format summary roughly in "APA Style" (American Psychological Association).</i>
--------	--------------------------------------------------------------------------------------

Description

Format summary roughly in "APA Style" (American Psychological Association).

Usage

```
render(  
  statistic,  
  ...,  
  format,  
  statDigits = 4,  
  sigDigits = 4,  
  pLargeCutoff = 0.05,  
  pSmallCutoff = 1e-05  
)
```

Arguments

statistic	sigr summary statistic
...	extra arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summaries.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

See Also

[render.sigr_significance](#), [render.sigr_ftest](#)

render.sig_r_aucpairtest

Format an AUC-test (quality of a probability score)

Description

Format an AUC-test (quality of a probability score)

Usage

```
## S3 method for class 'sig_r_aucpairtest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped AUC test
...	not used, force use of named binding for later arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summaries.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

render.sig_r_aucpermtest

Format an AUC-test (quality of a probability score)

Description

Format an AUC-test (quality of a probability score)

Usage

```
## S3 method for class 'sigr_aucpermtest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped AUC test
...	not used, force use of named binding for later arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summaries.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

render.sigr_aucresamp

Format an AUC-test (quality of a probability score)

Description

Format an AUC-test (quality of a probability score)

Usage

```
## S3 method for class 'sigr_aucresamp'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped AUC test
...	not used, force use of named binding for later arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summaries.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

render.sigr_Bernoulli_diff_test

Format sigr_Bernoulli_diff_test (test of difference of Bernoulli processes).

Description

Format sigr_Bernoulli_diff_test (test of difference of Bernoulli processes).

Usage

```
## S3 method for class 'sigr_Bernoulli_diff_test'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped cor.test.
...	extra arguments (not used)
format	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)
statDigits	integer number of digits to show in summaries.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

Examples

```
Bernoulli_diff_stat(2000, 5000, 100, 200)
Bernoulli_diff_stat(2000, 5000, 100, 200, 0.1)
Bernoulli_diff_stat(2000, 5000, 100, 199)
Bernoulli_diff_stat(2000, 5000, 100, 199, 0.1)
```

`render.sigr_binomtest` *Format binom.test (test of rate of a Binomial/Bernoulli experiment).*

Description

Format binom.test (test of rate of a Binomial/Bernoulli experiment).

Usage

```
## S3 method for class 'sigr_binomtest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

<code>statistic</code>	wrapped binom.test.
<code>...</code>	extra arguments (not used)
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string

Examples

```
bt <- binom.test(7, 10, 0.5)
wrapBinomTest(bt)
```

`render.sigr_chisqtest` *Format a chi-square test (quality of categorical prediction)*

Description

Format a chi-square test (quality of categorical prediction)

Usage

```
## S3 method for class 'sigr_chisqtest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

<code>statistic</code>	wrapped T-test
<code>...</code>	not used, force use of named binding for later arguments
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii")
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string

render.sig_r_cohend	<i>Format Cohen-D (effect size between groups)</i>
---------------------	----------------------------------------------------

Description

Format Cohen-D (effect size between groups)

Usage

```
## S3 method for class 'sig_r_cohend'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 1,
  pSmallCutoff = 0
)
```

Arguments

<code>statistic</code>	CohenD-approximation
<code>...</code>	not used, force use of named binding for later arguments
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii")
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string

render.sig_r_cortest	<i>Format cor.test (test of liner correlation).</i>
----------------------	-----------------------------------------------------

Description

Format cor.test (test of liner correlation).

Usage

```
## S3 method for class 'sigr_cortest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

<code>statistic</code>	wrapped cor.test.
<code>...</code>	extra arguments (not used)
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
ct <- cor.test(d$x,d$y)
wrapCorTest(ct)
```

`render.sig_r_emptest` *Format an empirical test (quality of categorical prediction)*

Description

Format an empirical test (quality of categorical prediction)

Usage

```
## S3 method for class 'sigr_emptest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped T-test
...	not used, force use of named binding for later arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summaries.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

render.sigr_fishertest

Format fisher.test (test of categorical independence).

Description

Format fisher.test (test of categorical independence).

Usage

```
## S3 method for class 'sigr_fishertest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

<code>statistic</code>	wrapped Fisher test
<code>...</code>	extra arguments (not used)
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string and fields

Examples

```
d <- data.frame(x=c('b','a','a','a','b','b','b'),
                 y=c('1','1','1','2','2','2','2'))
ft <- fisher.test(table(d))
wrapFisherTest(ft)
```

`render.sig_ftest` *Format an F-test*

Description

Format an F-test

Usage

```
## S3 method for class 'sig_ftest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped test
...	not used, force use of named binding for later arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summaries.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

`render.sigr_permtest` *Format an empirical test (quality of categorical prediction)*

Description

Format an empirical test (quality of categorical prediction)

Usage

```
## S3 method for class 'sigr_permtest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped T-test
...	not used, force use of named binding for later arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summary.
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

`render.sig_r_pwr_htest` *Format a pwr-test*

Description

Format a pwr-test

Usage

```
## S3 method for class 'sig_r_pwr_htest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 1,
  pSmallCutoff = 1e-05
)
```

Arguments

<code>statistic</code>	wrapped test from pwr package
<code>...</code>	not used, force use of named binding for later arguments
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii")
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string

`render.sig_r_significance`
Format a significance

Description

Format a significance

Usage

```
## S3 method for class 'sigr_significance'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

statistic	wrapped significance
...	not used, force use of named binding for later arguments
format	if set the format to return ("html", "latex", "markdown", "ascii")
statDigits	integer number of digits to show in summaries (not used in significance reports).
sigDigits	integer number of digits to show in significances.
pLargeCutoff	value to declare non-significance at or above.
pSmallCutoff	smallest value to print

Value

formatted string

Examples

```
cat(render(wrapSignificance(1/300), format='html'))
```

render.sig_tinterval Format a Student-T tolerance-style interval around an estimate of a mean.

Description

Report sample size (n), sample mean, bias-corrected standard deviation estimate (assuming normality, using a chi-square distribution correction from https://en.wikipedia.org/wiki/Unbiased_estimation_of_standard_deviation#Bias_correction), and a Student t-test tolerance-style confidence interval.

Usage

```
## S3 method for class 'sigr_tinterval'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

<code>statistic</code>	wrapped TInterval.
<code>...</code>	extra arguments (not used)
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string

Examples

```
set.seed(2018)
d <- rnorm(100) + 3.2
TInterval(d)
```

<code>render.sig_ttest</code>	<i>Format a T-test (difference in means by group)</i>
-------------------------------	-------------------------------------------------------

Description

Format a T-test (difference in means by group)

Usage

```
## S3 method for class 'sigr_ttest'
render(
  statistic,
  ...,
  format,
  statDigits = 4,
  sigDigits = 4,
  pLargeCutoff = 0.05,
  pSmallCutoff = 1e-05
)
```

Arguments

<code>statistic</code>	wrapped T-test
<code>...</code>	not used, force use of named binding for later arguments
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii")
<code>statDigits</code>	integer number of digits to show in summaries.
<code>sigDigits</code>	integer number of digits to show in significances.
<code>pLargeCutoff</code>	value to declare non-significance at or above.
<code>pSmallCutoff</code>	smallest value to print

Value

formatted string

<code>resampleScoreModel</code>	<i>Studentized</i>	<i>bootstrap</i>	<i>variance</i>	<i>estimate</i>	<i>for</i>
	<i>scoreFn(yValues,modelValues).</i>				

Description

Studentized bootstrap variance estimate for `scoreFn(yValues,modelValues)`.

Usage

```
resampleScoreModel(
  modelValues,
  yValues,
  scoreFn,
  ...,
  na.rm = FALSE,
  returnScores = FALSE,
  nRep = 100,
  parallelCluster = NULL
)
```

Arguments

modelValues	numeric array of predictions (model to test).
yValues	numeric/logical array of outcomes, dependent, or truth values
scoreFn	function with signature scoreFn(modelValues,yValues) returning scalar numeric score.
...	not used, forces later arguments to be bound by name
na.rm	logical, if TRUE remove NA values
returnScores	logical if TRUE return detailed resampledScores
nRep	integer number of repetitions to perform
parallelCluster	optional snow-style parallel cluster.

Value

summaries

Examples

```
set.seed(25325)
y <- 1:5
m1 <- c(1,1,2,2,2)
cor.test(m1,y,alternative='greater')
f <- function(modelValues,yValues) {
  if((sd(modelValues)<=0)|| (sd(yValues)<=0)) {
    return(0)
  }
  cor(modelValues,yValues)
}
s <- sigr::resampleScoreModel(m1,y,f)
print(s)
z <- (s$observedScore-0)/s$sd # should check size of z relative to bias!
pValue <- pt(z,df=length(y)-2,lower.tail=FALSE)
pValue
```

resampleScoreModelPair

*Studentized bootstrap test of strength of
scoreFn(yValues,model1Values) > scoreFn(yValues,model1Values).*

Description

Studentized bootstrap test of strength of $\text{scoreFn}(y\text{Values},\text{model1Values}) > \text{scoreFn}(y\text{Values},\text{model1Values})$ sampled with replacement.

Usage

```
resampleScoreModelPair(
  model1Values,
  model2Values,
  yValues,
  scoreFn,
  ...,
  na.rm = FALSE,
  returnScores = FALSE,
  nRep = 100,
  parallelCluster = NULL,
  sameSample = FALSE
)
```

Arguments

model1Values	numeric array of predictions (model to test).
model2Values	numeric array of predictions (reference model).
yValues	numeric/logical array of outcomes, dependent, or truth values
scoreFn	function with signature scoreFn(modelValues,yValues) returning scalar numeric score.
...	not used, forces later arguments to be bound by name.
na.rm	logical, if TRUE remove NA values
returnScores	logical if TRUE return detailed resampledScores.
nRep	integer number of repetitions to perform.
parallelCluster	optional snow-style parallel cluster.
sameSample	logical if TRUE use the same sample in computing both scores during bootstrap replication (else use independent samples).

Details

True confidence intervals are harder to get right (see "An Introduction to the Bootstrap", Bradely Efron, and Robert J. Tibshirani, Chapman & Hall/CRC, 1993.), but we will settle for simple p-value estimates.

Value

summaries

Examples

```
set.seed(25325)
y <- 1:5
m1 <- c(1,1,2,2,2)
```

```

m2 <- c(1,1,1,1,2)
cor(m1,y)
cor(m2,y)
f <- function(modelValues,yValues) {
  if((sd(modelValues)<=0)|| (sd(yValues)<=0)) {
    return(0)
  }
  cor(modelValues,yValues)
}
resampleScoreModelPair(m1,m2,y,f)

```

resampleTestAUC*Wrap AUC resampling test results.***Description**

Estimate significance of AUC by resampling test.

Usage

```

resampleTestAUC(
  d,
  modelName,
  yName,
  yTarget = TRUE,
  ...,
  na.rm = FALSE,
  returnScores = FALSE,
  nrep = 100,
  parallelCluster = NULL
)

```

Arguments

d	data.frame
modelName	character model column name
yName	character outcome column name
yTarget	target to match to y
...	extra arguments (not used)
na.rm	logical, if TRUE remove NA values
returnScores	logical if TRUE return detailed resampledScores.
nrep	number of permutation repetitions to estimate p values.
parallelCluster	(optional) a cluster object created by package parallel or package snow.

Value

AUC statistic

Examples

```
set.seed(25325)
d <- data.frame(x1=c(1,2,3,4,5,6,7,7),
                 y=c(FALSE,TRUE,FALSE, FALSE,
                      TRUE,TRUE,FALSE,TRUE))
resampleTestAUC(d,'x1','y',TRUE)
```

sensitivity_and_specificity_s12p12n

Compute the shape1_pos, shape2_pos, shape1_neg, shape2_neg graph.

Description

Compute specificity and sensitivity given specificity and model fit parameters.

Usage

```
sensitivity_and_specificity_s12p12n(
  Score,
  ...,
  shape1_pos,
  shape2_pos,
  shape1_neg,
  shape2_neg
)
```

Arguments

Score	vector of sensitivities to evaluate
...	force later arguments to bind by name.
shape1_pos	beta shape1 parameter for positive examples
shape2_pos	beta shape2 parameter for positive examples
shape1_neg	beta shape1 parameter for negative examples
shape2_neg	beta shape1 parameter for negative examples

Value

Score, Specificity and Sensitivity data frame

Examples

```

library(wrapr)

empirical_data <- rbind(
  data.frame(
    Score = rbeta(1000, shape1 = 3, shape2 = 2),
    y = TRUE),
  data.frame(
    Score = rbeta(1000, shape1 = 5, shape2 = 4),
    y = FALSE)
)

unpack[shape1_pos = shape1, shape2_pos = shape2] <-
  fit_beta_shapes(empirical_data$Score[empirical_data$y])

shape1_pos
shape2_pos

unpack[shape1_neg = shape1, shape2_neg = shape2] <-
  fit_beta_shapes(empirical_data$Score[!empirical_data$y])

shape1_neg
shape2_neg

ideal_roc <- sensitivity_and_specificity_s12p12n(
  seq(0, 1, 0.1),
  shape1_pos = shape1_pos,
  shape1_neg = shape1_neg,
  shape2_pos = shape2_pos,
  shape2_neg = shape2_neg)

empirical_roc <- build_ROC_curve(
  modelPredictions = empirical_data$Score,
  yValues = empirical_data$y
)

# # should look very similar
# library(ggplot2)
# ggplot(mapping = aes(x = 1 - Specificity, y = Sensitivity)) +
#   geom_line(data = empirical_roc, color='DarkBlue') +
#   geom_line(data = ideal_roc, color = 'Orange')

```

sensitivity_from_specificity_q
Compute the q-graph.

Description

Based on: <https://blog.revolutionanalytics.com/2016/08/roc-curves-in-two-lines-of-code.html>

Usage

```
sensitivity_from_specificity_q(Specificity, q)
```

Arguments

Specificity	vector of sensitivities to evaluate
q	shape parameter for $1 - (1 - (1 - \text{Specificity})^q)^{(1/q)}$

Value

Sensitivity

Examples

```
sensitivity_from_specificity_q(seq(0, 1, 0.1), 0.61)
```

testAUCpair

Test AUC pair results.

Description

Estimate significance of difference in two AUCs by resampling.

Usage

```
testAUCpair(  
  d,  
  model1Name,  
  model2Name,  
  yName,  
  yTarget = TRUE,  
  ...,  
  na.rm = FALSE,  
  returnScores = FALSE,  
  nrep = 100,  
  parallelCluster = NULL  
)
```

Arguments

d	data.frame
model1Name	character model 1 column name
model2Name	character model 2 column name
yName	character outcome column name
yTarget	target to match to y
...	extra arguments (not used)
na.rm	logical, if TRUE remove NA values
returnScores	logical if TRUE return detailed resampledScores
nrep	number of re-sample repetition to estimate p value.
parallelCluster	(optional) a cluster object created by package parallel or package snow

Value

AUC pair test

Examples

```
set.seed(25325)
d <- data.frame(x1=c(1,2,3,4,5,6,7,7),
                 x2=1,
                 y=c(FALSE,TRUE,FALSE,FALSE,
                     TRUE,TRUE,FALSE,TRUE))
testAUCpair(d, 'x1', 'x2', 'y', TRUE)
```

TInterval

Wrap TInterval (test of Binomial/Bernoulli rate).

Description

Wrap TInterval (test of Binomial/Bernoulli rate).

Usage

```
TInterval(x, ...)
```

Arguments

x	numeric, data.frame or test.
...	extra arguments

See Also

[TIntervals](#), [TInterval.numeric](#), [TInterval.data.frame](#)

TInterval.data.frame *Student-T tolerance-style interval around an estimate of a mean from a data.frame.*

Description

Student-T tolerance-style interval around an estimate of a mean from a data.frame.

Usage

```
## S3 method for class 'data.frame'  
TInterval(x, ColumnName, ..., conf.level = 0.95, na.rm = FALSE)
```

Arguments

x	data.frame
ColumnName	character name of measurement column
...	extra arguments passed to TInterval
conf.level	confidence level to draw interval
na.rm	logical, if TRUE remove NA values

Value

wrapped stat

See Also

[TInterval](#), [TIntervals](#), [TInterval.numeric](#), [TInterval.data.frame](#)

Examples

```
set.seed(2018)  
d <- data.frame(x = rnorm(100) + 3.2)  
TInterval(d, "x")
```

TInterval.numeric *Student-T tolerance-style interval around an estimate of a mean from observations.*

Description

Student-T tolerance-style interval around an estimate of a mean from observations.

Usage

```
## S3 method for class 'numeric'
TInterval(x, ..., conf.level = 0.95, na.rm = FALSE)
```

Arguments

x	logical, vector of observations.
...	extra arguments passed to TInterval
conf.level	confidence level to draw interval
na.rm	logical, if TRUE remove NA values

Value

wrapped stat

See Also

[TInterval](#), [TIntervals](#), [TInterval.numeric](#), [TInterval.data.frame](#)

Examples

```
set.seed(2018)
d <- rnorm(100) + 3.2
TInterval(d)
```

TIntervals	<i>Student-T tolerance-style interval around an estimate of a mean from summary.</i>
------------	--------------------------------------------------------------------------------------

Description

Student-T tolerance-style interval around an estimate of a mean from summary.

Usage

```
TIntervals(  
  sample_size,  
  sample_mean,  
  sample_var,  
  ...,  
  nNA = 0,  
  conf.level = 0.95  
)
```

Arguments

sample_size	numeric scalar integer, size of sample.
sample_mean	numeric scalar, mean of sample.
sample_var	numeric scalar, variance of sample (Bessel-corrected).
...	extra arguments passed to TInterval.
nNA	number of NAs seen.
conf.level	confidence level to draw interval

Value

wrapped stat

See Also

[TInterval](#), [TIntervals](#), [TInterval.numeric](#), [TInterval.data.frame](#)

Examples

```
set.seed(2018)  
d <- rnorm(100) + 3.2  
TIntervals(length(d), mean(d), stats::var(d))
```

wrapBinomTest*Wrap binom.test (test of Binomial/Bernoulli rate).*

Description

Wrap binom.test (test of Binomial/Bernoulli rate).

Usage

```
wrapBinomTest(x, ...)
```

Arguments

<code>x</code>	numeric, data.frame or test.
<code>...</code>	extra arguments

See Also

[wrapBinomTest.htest](#), [wrapBinomTestS](#), [wrapBinomTest.logical](#), [wrapBinomTest.numeric](#),
[wrapBinomTest.data.frame](#)

wrapBinomTest.data.frame*Wrap binom.test (test of Binomial/Bernoulli rate).*

Description

Wrap binom.test (test of Binomial/Bernoulli rate).

Usage

```
## S3 method for class 'data.frame'
wrapBinomTest(
  x,
  ColumnName,
  SuccessValue = TRUE,
  ...,
  p = NA,
  alternative = c("two.sided", "less", "greater"),
  conf.level = 0.95,
  na.rm = FALSE
)
```

Arguments

x	data.frame
ColumnName	character name of measurement column
SuccessValue	value considered a success (positive)
...	extra arguments passed to binom.test
p	number, hypothesized probability of success.
alternative	passed to <code>binom.test</code>
conf.level	passed to <code>binom.test</code>
na.rm	logical, if TRUE remove NA values

Value

wrapped stat

See Also

`wrapBinomTest`, `wrapBinomTest.htest`, `wrapBinomTestS`, `wrapBinomTest.logical`, `wrapBinomTest.numeric`, `wrapBinomTest.data.frame`

Examples

```
d <- data.frame(x = c(rep(0, 3), rep(1, 7)))
wrapBinomTest(d, "x", 1, p = 0.5)
d <- data.frame(x = c(rep(0, 15), rep(1, 35)))
wrapBinomTest(d, "x", 1, p = 0.5)
```

`wrapBinomTest.htest` *Wrap binom.test (test of Binomial/Bernoulli rate).*

Description

Wrap `binom.test` (test of Binomial/Bernoulli rate).

Usage

```
## S3 method for class 'htest'
wrapBinomTest(x, ...)
```

Arguments

x	binom.test result
...	not used, just for argument compatibility

Value

wrapped stat

See Also

`wrapBinomTest`, `wrapBinomTest.htest`, `wrapBinomTestS`, `wrapBinomTest.logical`, `wrapBinomTest.numeric`,
`wrapBinomTest.data.frame`

Examples

```
bt <- binom.test(7, 10, 0.5)
wrapBinomTest(bt)
```

`wrapBinomTest.logical` *Wrap binom.test (test of Binomial/Bernoulli rate).*

Description

Wrap `binom.test` (test of Binomial/Bernoulli rate).

Usage

```
## S3 method for class 'logical'
wrapBinomTest(
  x,
  ...,
  p = NA,
  alternative = c("two.sided", "less", "greater"),
  conf.level = 0.95,
  na.rm = FALSE
)
```

Arguments

<code>x</code>	logical, vector of trials.
<code>...</code>	extra arguments passed to <code>binom.test</code>
<code>p</code>	number, hypothesized probability of success.
<code>alternative</code>	passed to <code>binom.test</code>
<code>conf.level</code>	passed to <code>binom.test</code>
<code>na.rm</code>	logical, if TRUE remove NA values

Value

wrapped stat

wrapBinomTest(x)
x = c(rep(FALSE, 15), rep(TRUE, 35))
wrapBinomTest(x)
```

wrapBinomTest.numeric *Wrap binom.test (test of Binomial/Bernoulli rate).*

Description

Wrap binom.test (test of Binomial/Bernoulli rate).

Usage

```
## S3 method for class 'numeric'
wrapBinomTest(
  x,
  SuccessValue = TRUE,
  ...,
  p = NA,
  alternative = c("two.sided", "less", "greater"),
  conf.level = 0.95,
  na.rm = FALSE
)
```

Arguments

<code>x</code>	numeric, vector of trials.
<code>SuccessValue</code>	value considered a success (positive)
<code>...</code>	extra arguments passed to binom.test
<code>p</code>	number, hypothesized probability of success.
<code>alternative</code>	passed to <code>binom.test</code>
<code>conf.level</code>	passed to <code>binom.test</code>
<code>na.rm</code>	logical, if TRUE remove NA values

Value

wrapped stat

See Also

```
x = c(rep(0, 3), rep(1, 7))
wrapBinomTest(x, 1)
x = c(rep(0, 15), rep(1, 35))
wrapBinomTest(x, 1)
```

wrapBinomTestS

Wrap binom.test (test of Binomial/Bernoulli rate) from summary.

Description

Wrap binom.test (test of Binomial/Bernoulli rate) from summary.

Usage

```
wrapBinomTestS(
  x,
  n,
  ...,
  p = NA,
  alternative = c("two.sided", "less", "greater"),
  conf.level = 0.95
)
```

Arguments

x	numeric scalar, number of successes.
n	numeric scalar, number of trials.
...	extra arguments passed to binom.test
p	number, hypothesized probability of success.
alternative	passed to binom.test
conf.level	passed to binom.test

Value

wrapped stat

wrapBinomTestS(300, 700, p = 0.5)
```

wrapChiSqTest *Wrap quality of a categorical prediction roughly in "APA Style" (American Psychological Association).*

Description

Wrap quality of a categorical prediction roughly in "APA Style" (American Psychological Association).

Usage

```
wrapChiSqTest(x, ...)
```

Arguments

x numeric, data.frame or lm where to get model or data to score.
... extra arguments

See Also

[wrapChiSqTestImpl](#), [wrapChiSqTest.glm](#), and [wrapChiSqTest.data.frame](#)

wrapChiSqTest.anova *Format ChiSqTest from anova of logistic model.*

Description

Format ChiSqTest from anova of logistic model.

Usage

```
## S3 method for class 'anova'
wrapChiSqTest(x, ...)
```

Arguments

x	result from stats::anova(stats::glm(family=binomial))
...	extra arguments (not used)

Value

list of formatted string and fields

Examples

```
d <- data.frame(x1= c(1,2,3,4,5,6,7,7),
                 x2= c(1,0,3,0,5,0,7,0),
                 y= c(TRUE,FALSE,FALSE,FALSE,TRUE,TRUE,TRUE,FALSE))
model <- glm(y~x1+x2, data=d, family=binomial)
summary(model)
render(wrapChiSqTest(model),
       pLargeCutoff=1, format='ascii')
anov <- anova(model)
print(anov)
lapply(sigr::wrapChiSqTest(anov),
      function(ti) {
        sigr::render(ti,
                     pLargeCutoff= 1,
                     pSmallCutoff= 0,
                     statDigits=4,
                     sigDigits=4,
                     format='ascii')
      })
})
```

wrapChiSqTest.data.frame

Format ChiSqTest from data.

Description

Format ChiSqTest from data.

Usage

```
## S3 method for class 'data.frame'
wrapChiSqTest(
  x,
  predictionColumnName,
  yColumnName,
  ...,
  yTarget = TRUE,
```

```
nParameters = 1,
meany = mean(x[[yColumnName]] == yTarget),
na.rm = FALSE
)
```

Arguments

x	data frame containing columns to compare
predictionColumnName	character name of prediction column
yColumnName	character name of column containing dependent variable
...	extra arguments (not used)
yTarget	y value to consider positive
nParameters	number of variables in model
meany	(optional) mean of y
na.rm	logical, if TRUE remove NA values

Value

wrapped test

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(TRUE,FALSE,FALSE,TRUE,TRUE,TRUE,TRUE,FALSE))
model <- glm(y~x, data=d, family=binomial)
summary(model)
d$pred <- predict(model,type='response',newdata=d)
render(wrapChiSqTest(d,'pred','y'),pLargeCutoff=1)
```

wrapChiSqTest.glm *Format ChiSqTest from model.*

Description

Format ChiSqTest from model.

Usage

```
## S3 method for class 'glm'
wrapChiSqTest(x, ...)
```

Arguments

- x glm logistic regression model (glm(family=binomial))
- ... extra arguments (not used)

Value

wrapped test

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(TRUE,FALSE,FALSE,TRUE,TRUE,TRUE,FALSE))
model <- glm(y~x,data=d,family=binomial)
summary(model)
render(wrapChiSqTest(model),pLargeCutoff=1,format='ascii')
```

wrapChiSqTest.summary.glm

Format ChiSqTest from model summary.

Description

Format ChiSqTest from model summary.

Usage

```
## S3 method for class 'summary.glm'
wrapChiSqTest(x, ...)
```

Arguments

- x summary(glm(family=binomial)) object.
- ... extra arguments (not used)

Value

wrapped test

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(TRUE, FALSE, FALSE, FALSE, TRUE, TRUE, TRUE, FALSE))
model <- glm(y~x,data=d,family=binomial)
sum <- summary(model)
render(wrapChiSqTest(sum),pLargeCutoff=1,format='ascii')
```

wrapChiSqTestImpl *Format quality of a logistic regression roughly in "APA Style" (American Psychological Association).*

Description

Format quality of a logistic regression roughly in "APA Style" (American Psychological Association).

Usage

```
wrapChiSqTestImpl(df.null, df.residual, null.deviance, deviance)
```

Arguments

df.null	null degrees of freedom.
df.residual	residual degrees of freedom.
null.deviance	null deviance
deviance	residual deviance

Value

wrapped statistic

Examples

```
wrapChiSqTestImpl(df.null=7,df.residual=6,
                  null.deviance=11.09035,deviance=10.83726)
```

wrapCohenD*Wrap Cohen's D (effect size between groups).***Description**

Wrap Cohen's D (effect size between groups).

Usage

```
wrapCohenD(x, ...)
```

Arguments

- | | |
|-----|------------------------------|
| x | numeric, data.frame or test. |
| ... | extra arguments |

See Also

[wrapCohenD.data.frame](#)

wrapCohenD.data.frame *Wrap Cohen's D (effect size between groups).***Description**

Wrap Cohen's D (effect size between groups).

Usage

```
## S3 method for class 'data.frame'
wrapCohenD(x, Column1Name, Column2Name, ..., na.rm = FALSE)
```

Arguments

- | | |
|-------------|----------------------------|
| x | data.frame |
| Column1Name | character column 1 name |
| Column2Name | character column 2 name |
| ... | extra arguments (not used) |
| na.rm | if TRUE remove NAs |

Value

formatted string and fields

Examples

```
d <- data.frame(x = c(1,1,2,2,3,3,4,4),
                 y = c(1,2,3,4,5,6,7,7))
render(wrapCohenD(d, 'x', 'y'))
```

wrapCohenD.numeric *Wrap Cohen's D (effect size between groups).*

Description

Wrap Cohen's D (effect size between groups).

Usage

```
## S3 method for class 'numeric'
wrapCohenD(x, treatment, ..., na.rm = FALSE)
```

Arguments

x	numeric reference or control measurements
treatment	numeric treatment or group-2 measurements
...	extra arguments (not used)
na.rm	if TRUE remove NAs

Value

formatted string and fields

Examples

```
d <- data.frame(x = c(1,1,2,2,3,3,4,4),
                 y = c(1,2,3,4,5,6,7,7))
render(wrapCohenD(d$x, d$y))
```

wrapCorTest*Wrap cor.test (test of liner correlation).***Description**

Wrap cor.test (test of liner correlation).

Usage

```
wrapCorTest(x, ...)
```

Arguments

x	numeric, data.frame or test.
...	extra arguments

See Also

[wrapCorTest.htest](#), and [wrapCorTest.data.frame](#)

wrapCorTest.data.frame*Wrap cor.test (test of liner correlation).***Description**

Wrap cor.test (test of liner correlation).

Usage

```
## S3 method for class 'data.frame'
wrapCorTest(
  x,
  Column1Name,
  Column2Name,
  ...,
  alternative = c("two.sided", "less", "greater"),
  method = c("pearson", "kendall", "spearman"),
  exact = NULL,
  conf.level = 0.95,
  continuity = FALSE,
  na.rm = FALSE
)
```

Arguments

x	data.frame
Column1Name	character column 1 name
Column2Name	character column 2 name
...	extra arguments passed to cor.test
alternative	passed to <code>cor.test</code>
method	passed to <code>cor.test</code>
exact	passed to <code>cor.test</code>
conf.level	passed to <code>cor.test</code>
continuity	passed to <code>cor.test</code>
na.rm	logical, if TRUE remove NA values

Value

wrapped stat

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
wrapCorTest(d, 'x', 'y')
```

`wrapCorTest.htest`

Wrap cor.test (test of liner correlation).

Description

Wrap cor.test (test of liner correlation).

Usage

```
## S3 method for class 'htest'
wrapCorTest(x, ...)
```

Arguments

x	cor.test result
...	extra arguments (not used)

Value

wrapped stat

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
ct <- cor.test(d$x,d$y)
wrapCorTest(ct)
```

`wrapFisherTest`

Wrap fisher.test (test of categorical independence).

Description

Wrap fisher.test (test of categorical independence).

Usage

```
wrapFisherTest(x, ...)
```

Arguments

<code>x</code>	numeric, data.frame or test.
<code>...</code>	extra arguments

See Also

[wrapFisherTest.htest](#), and [wrapFisherTest.data.frame](#)

`wrapFisherTest.data.frame`

Wrap fisher.test (test of categorical independence).

Description

Wrap fisher.test (test of categorical independence).

Usage

```
## S3 method for class 'data.frame'  
wrapFisherTest(  
  x,  
  Column1Name,  
  Column2Name,  
  ...,  
  na.rm = FALSE,  
  workspace = 2e+05,  
  hybrid = FALSE,  
  control = list(),  
  or = 1,  
  alternative = "two.sided",  
  conf.int = TRUE,  
  conf.level = 0.95,  
  simulate.p.value = FALSE,  
  B = 2000  
)
```

Arguments

x	data.frame
Column1Name	character column 1 name
Column2Name	character column 2 name
...	extra arguments (not used)
na.rm	logical, if TRUE remove NA values
workspace	passed to fisher.test
hybrid	passed to fisher.test
control	passed to fisher.test
or	passed to fisher.test
alternative	passed to fisher.test
conf.int	passed to fisher.test
conf.level	passed to fisher.test
simulate.p.value	passed to fisher.test
B	passed to fisher.test

Value

wrapped test.

Examples

```
d <- data.frame(x=c('b','a','a','a','b','b','b'),
                 y=c('1','1','1','2','2','2','2'))
wrapFisherTest(d, 'x', 'y')
```

wrapFisherTest.htest *Wrap fisher.test (test of categorical independence).*

Description

Wrap fisher.test (test of categorical independence).

Usage

```
## S3 method for class 'htest'
wrapFisherTest(x, ...)
```

Arguments

x	fisher.test result
...	extra arguments (not used)

Value

wrapped test.

Examples

```
d <- data.frame(x=c('b','a','a','a','b','b','b'),
                 y=c('1','1','1','2','2','2','2'))
ft <- fisher.test(table(d))
wrapFisherTest(ft)
```

`wrapFisherTest.table` *Wrap fisher.test (test of categorical independence).*

Description

Wrap `fisher.test` (test of categorical independence).

Usage

```
## S3 method for class 'table'  
wrapFisherTest(  
  x,  
  ...,  
  workspace = 2e+05,  
  hybrid = FALSE,  
  control = list(),  
  or = 1,  
  alternative = "two.sided",  
  conf.int = TRUE,  
  conf.level = 0.95,  
  simulate.p.value = FALSE,  
  B = 2000  
)
```

Arguments

x	data.frame
...	extra arguments (not used)
workspace	passed to <code>fisher.test</code>
hybrid	passed to <code>fisher.test</code>
control	passed to <code>fisher.test</code>
or	passed to <code>fisher.test</code>
alternative	passed to <code>fisher.test</code>
conf.int	passed to <code>fisher.test</code>
conf.level	passed to <code>fisher.test</code>
simulate.p.value	passed to <code>fisher.test</code>
B	passed to <code>fisher.test</code>

Value

wrapped test.

Examples

```
d <- data.frame(x=c('b','a','a','a','b','b','b'),
                 y=c('1','1','1','2','2','2','2'))
t <- table(d)
wrapFisherTest(t)
```

`wrapFTest`

Wrap F-test (significance identity relation).

Description

Wrap F-test (significance identity relation).

Usage

```
wrapFTest(x, ...)
```

Arguments

- x numeric, data.frame or lm where to get model or data to score.
- ... extra arguments

See Also

[wrapFTestImpl](#), [wrapFTest.lm](#), and [wrapFTest.data.frame](#)

`wrapFTest.anova`

Wrap quality statistic of a linear relation from anova.

Description

Wrap quality statistic of a linear relation from anova.

Usage

```
## S3 method for class 'anova'
wrapFTest(x, ...)
```

Arguments

- x result from stats::anova(stats::lm())
- ... extra arguments (not used)

Value

list of formatted string and fields

Examples

```
d <- data.frame(x1 = c(1,2,3,4,5,6,7,7),
                 x2 = c(1,0,3,0,5,6,0,7),
                 y = c(1,1,2,2,3,3,4,4))
model <- lm(y~x1+x2, data=d)
summary(model)
sigr::wrapFTest(model)
anova <- stats::anova(model)
print(anova)
lapply(sigr::wrapFTest(anova),
      function(ti) {
        sigr::render(ti,
                     pLargeCutoff= 1,
                     pSmallCutoff= 0,
                     statDigits=4,
                     sigDigits=4,
                     format='ascii')
      })
})
```

`wrapFTest.data.frame` *Wrap quality statistic of identity relation from data.*

Description

Wrap quality statistic of identity relation from data.

Usage

```
## S3 method for class 'data.frame'
wrapFTest(
  x,
  predictionColumnName,
  yColumnName,
  nParameters = 1,
  meany = mean(x[[yColumnName]]),
  ...,
  na.rm = FALSE,
  format = NULL
)
```

Arguments

x	data frame containing columns to compare
predictionColumnName	character name of prediction column
yColumnName	character name of column containing dependent variable
nParameters	number of variables in model
meany	(optional) mean of y
...	extra arguments (not used)
na.rm	logical, if TRUE remove NA values
format	if set the format to return ("html", "latex", "markdown", "ascii", "docx")

Value

formatted string and fields

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
model <- lm(y~x,data=d)
summary(model)
d$pred <- predict(model,newdata=d)
sigr::wrapFTest(d,'pred','y')
```

wrapFTest.htest

Wrap F-test (ratio of variances).

Description

Wrap F-test (ratio of variances).

Usage

```
## S3 method for class 'htest'
wrapFTest(x, ..., format = NULL)
```

Arguments

x	lm model
...	extra arguments (not used)
format	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)

Value

formatted string

Examples

```
v <- var.test(c(1,2,3,4,5,6,7,7), c(1, 1, 2))
sigr::wrapFTest(v)
```

`wrapFTest.lm`

Wrap quality statistic of identity r regression.

Description

Wrap quality statistic of identity r regression.

Usage

```
## S3 method for class 'lm'
wrapFTest(x, ..., format = NULL)
```

Arguments

<code>x</code>	lm model
<code>...</code>	extra arguments (not used)
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)

Value

formatted string

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
model <- lm(y~x,data=d)
summary(model)
sigr::wrapFTest(model)
```

`wrapFTest.summary.lm` *Wrap quality statistic of linear regression summary.*

Description

Wrap quality statistic of linear regression summary.

Usage

```
## S3 method for class 'summary.lm'
wrapFTest(x, ..., format = NULL)
```

Arguments

<code>x</code>	summary.lm summary(lm()) object
<code>...</code>	extra arguments (not used)
<code>format</code>	if set the format to return ("html", "latex", "markdown", "ascii", "docx", ...)

Value

formatted string

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
model <- lm(y~x,data=d)
sum <- summary(model)
sigr::wrapFTest(sum)
```

`wrapFTestezANOVA` *Wrap quality statistic of a linear relation from ezANOVA (package ez).*

Description

Please see <https://github.com/WinVector/sigr/issues/1#issuecomment-322311947> for an example.

Usage

```
wrapFTestezANOVA(x, ...)
```

Arguments

- x list result from ezANOVA (package ez).
- ... extra arguments (not used)

Value

list of formatted string and fields

wrapFTestImpl

Wrap F-test (significance of identity relation).

Description

Wrap F-test (significance of identity relation).

Usage

```
wrapFTestImpl(numdf, dendf, FValue, ..., format = NULL)
```

Arguments

- numdf degrees of freedom 1.
- dendf degrees of freedom 2.
- FValue observed F test statistic
- ... not used, force later arguments to bind by name
- format optional, suggested format

Value

wrapped statistic

Examples

```
wrapFTestImpl(numdf=2, dendf=55, FValue=5.56)
```

`wrapPWR`*Wrap pwr test (difference in means by group).***Description**

Wrap pwr test (difference in means by group).

Usage

```
wrapPWR(x, ...)
```

Arguments

<code>x</code>	test from pwr package
<code>...</code>	extra arguments

See Also

[pwr.2p.test](#)

`wrapPWR.power.htest`*Wrap pwr test.***Description**

Wrap pwr test.

Usage

```
## S3 method for class 'power.htest'
wrapPWR(x, ...)
```

Arguments

<code>x</code>	pwr test result
<code>...</code>	extra arguments (not used)

Value

formatted string and fields

Examples

```
if(require("pwr", quietly = TRUE)) {  
  # Example from pwr package  
  # Exercise 6.1 p. 198 from Cohen (1988)  
  test <- pwr::pwr.2p.test(h=0.3,n=80,sig.level=0.05,alternative="greater")  
  wrapPWR(test)  
}
```

wrapSignificance *Wrap a significance*

Description

Wrap a significance

Usage

```
wrapSignificance(significance, symbol = "p")
```

Arguments

significance numeric the significance value.
symbol the name of the value (e.g. "p", "t", ...).

Value

wrapped significance

Examples

```
wrapSignificance(1/300)
```

wrapTTest*Wrap t.test (difference in means by group).***Description**

Wrap t.test (difference in means by group).

Usage

```
wrapTTest(x, ...)
```

Arguments

x	numeric, data.frame or test.
...	extra arguments

See Also

[wrapTTest.htest](#), and [wrapTTest.data.frame](#)

wrapTTest.data.frame *Wrap t.test (difference in means by group).***Description**

Wrap t.test (difference in means by group).

Usage

```
## S3 method for class 'data.frame'
wrapTTest(
  x,
  Column1Name,
  Column2Name,
  ...,
  y = NULL,
  alternative = c("two.sided", "less", "greater"),
  mu = 0,
  paired = FALSE,
  var.equal = FALSE,
  conf.level = 0.95,
  na.rm = FALSE
)
```

Arguments

x	data.frame
Column1Name	character column 1 name
Column2Name	character column 2 name
...	extra arguments passed to ttest
y	passed to <code>t.test</code>
alternative	passed to <code>t.test</code>
mu	passed to <code>t.test</code>
paired	passed to <code>t.test</code>
var.equal	passed to <code>t.test</code>
conf.level	passed to <code>t.test</code>
na.rm	logical, if TRUE remove NA values

Value

formatted string and fields

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
render(wrapTTest(d,'x','y'),pLargeCutoff=1)
# confirm p not order depedent
render(wrapTTest(d,'y','x'),pLargeCutoff=1)
```

`wrapTTest.htest`

Wrap t.test (difference in means by group).

Description

Wrap t.test (difference in means by group).

Usage

```
## S3 method for class 'htest'
wrapTTest(x, ...)
```

Arguments

x	<code>t.test</code> result
...	extra arguments (not used)

Value

formatted string and fields

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                 y=c(1,1,2,2,3,3,4,4))
tt <- t.test(d$x,d$y)
render(wrapTTest(tt),pLargeCutoff=1)
# confirm not rescaling, as a correlation test would
render(wrapTTest(t.test(d$x,2*d$y)),pLargeCutoff=1)
```

wrapTTest.numeric

Wrap t.test (difference in means by group).

Description

Wrap t.test (difference in means by group).

Usage

```
## S3 method for class 'numeric'
wrapTTest(
  x,
  pop2,
  ...,
  y = NULL,
  alternative = c("two.sided", "less", "greater"),
  mu = 0,
  paired = FALSE,
  var.equal = FALSE,
  conf.level = 0.95,
  na.rm = FALSE
)
```

Arguments

x	numeric population 1
pop2	numeric population 2
...	extra arguments passed to ttest
y	passed to <code>t.test</code>
alternative	passed to <code>t.test</code>
mu	passed to <code>t.test</code>
paired	passed to <code>t.test</code>

```
var.equal      passed to t.test
conf.level     passed to t.test
na.rm         logical, if TRUE remove NA values
```

Value

formatted string and fields

Examples

```
d <- data.frame(x=c(1,2,3,4,5,6,7,7),
                  y=c(1,1,2,2,3,3,4,4))
render(wrapTTest(d$x, d$y), pLargeCutoff=1)
# confirm p not order depedent
render(wrapTTest(d$y, d$x),pLargeCutoff=1)
```
